

Weather Extension

Concepts

1. Data Fetching via OpenWeather API
2. TypeScript, React and Webpack
3. Chrome APIs (alarms, storage, etc...)
4. Core Extension Concepts (popup, options, background script, content script)
5. Material UI Components

Features

1. Displays temperature of multiple cities based on user input
2. Badge icon that updates hourly with the temperature of the user's home city
3. Weather overlay that can be displayed on a webpage as a user is browsing, controllable through the popup
4. Support for switching between metric and imperial temperature units
